11155 Rev1

Next generation aero engines...

11155 Rev.1

... Is based on many new technologies...

- > New materials
- > Blade shapes
- > Noise control
- > Cooling technologies
- > Control technologies
- >

... Which requires testing

- Component testing
- Engine test on the ground
- Flying test bed

Development needs design space expansion

- Scalable architectures – a platform need to cover a large range of thrust classes
- Large number of parameters in the design space – impossible to physically test all
- Current design space is conservative – but the limit is unknown

11155 Rev.1

Virtual TURbine Module demonstrator – VITUM

> Objective

- To define a virtual demonstrator to facilitate a (first) validation of technologies and design methods and capabilities in a context

> Expected benefits

- A virtual testbed to
 - Prepare hardware tests
 - Prepare method implementation and change management initiatives
 - Represent sufficient realism to engage users and researchers

VITUM methods and technology

- > New Development Process technologies (impact way of working)
 - Value Driven Design (BTH)
 - Functional modeling (Chalmers)
 - Link to analysis (Swerea)
 - Link to design criteria and product requirements (GKN)

- > New product technologies (enable new engine component designs)
 - Ceramic Matrix Composites (Swerea)
 - Supplier involvement in early design phases (Swerea)

- > Virtual Validation in a Turbine Exit Structure environment at GKN Aerospace

The VITUM scenario – overview, one loop

Concept evaluation phase

Summary

- > New design methods has been combined with insertion of new technologies in a "virtual demonstrator"
- > Researchers from three research organizations team up to share and integrate new approaches together with an industrial design team
- > Industrialist get a first hand experience with novel design methods – preparing hardware validation and implementation
- > Academics can validate novel design capabilities in a realistic context
