

CHALMERS

Uncertainty and Robustness in Aerospace Structures

ANDERS FORSLUND

Department of Product and Production Development
CHALMERS UNIVERSITY OF TECHNOLOGY
Gothenburg, Sweden 2016

In the aerospace industry...

”...a move towards **probabilistic design practices** has been recognized as a **potential game-changer**, as it is understood to reduce **costs, risks** and **lead times**, while increasing the **confidence** in analysis tools, and the **quality and reliability** of products“

Nasa report by Zang *et al.* (2002)

A different simulation approach...

Deterministic design

Nominal operation

Worst-case scenarios

Safety factors

Easy to implement in simulation

Probabilistic design

Adds variation modeling

Uses probability distributions, etc.

Allows some probability of failure

Difficult to implement in simulation

Probabilistic design → Robust design → Geometry assurance

Probabilistic design → Robust design → Geometry assurance

“Robust design is an engineering methodology that aims at minimizing the effects of variation without eliminating the variation itself. “

Phadke (1995)

Probabilistic design → Robust design → Geometry assurance

“*Geometry assurance* is a set of activities aimed at **reducing the effects of **geometric variation** and increasing the precision of **functional** attributes of products.”**

Söderberg *et al.* (2006)

Mathematical Modeling

Conceptual Modeling

2. Acceleration field: $\vec{a} = \frac{d\vec{v}}{dt} = \left(\frac{d\vec{u}}{dt}, \frac{d\vec{v}}{dt}, \frac{d\vec{w}}{dt} \right)$

applying chain rule

$$\frac{du}{dt} = \frac{\partial u}{\partial t} + \frac{\partial u}{\partial x} \left(\frac{dx}{dt} \right) + \frac{\partial u}{\partial y} \left(\frac{dy}{dt} \right) + \frac{\partial u}{\partial z} \left(\frac{dz}{dt} \right)$$

same can be said for $\frac{dv}{dt}$ and $\frac{dw}{dt}$

$$\frac{d\vec{u}}{dt} = \frac{\partial \vec{u}}{\partial t} + \frac{\partial \vec{u}}{\partial x} \cdot \vec{u} + \frac{\partial \vec{u}}{\partial y} \cdot \vec{v} + \frac{\partial \vec{u}}{\partial z} \cdot \vec{w}$$

local acceleration
[change of velocity with space]

or

$$\vec{a} = \left(\frac{\partial}{\partial t} + \vec{v} \cdot \nabla \right) \vec{v}$$

also called Material Derivative

Genetic algorithms (Papers D, E and G)

Genetic algorithms (GA) are search procedures that mimic the mechanics of natural selection and genetics ([Goldberg 2013](#)).

A combinatory problem

- 11 vanes
- $10! = 3,628,800$ different combinations!
- 10 minutes per fatigue life simulation \approx **70 years** of simulations

Conclusions

Conclusions – Research Questions I & II

Identified barriers

Model form error

Discretisation error

Backwards
incompatibility

Forward applicability

Proposed solutions

Parametric point method (PPM)

COTS Software independence and
redundancy

Conclusions – Research Question III

- Geometric variation has the most major impact within thermal fatigue analysis.
- The case studies showed that simulation results were heavily affected by geometric variation in parts and assemblies.
- Welding exacerbates the effects of geometric variation.
- Genetic algorithms can be used to mitigate these effects.

Future work

- We should improve the quality and technological maturity of the multidisciplinary simulation environment, including its breadth as well its depth.
- To make this research more comprehensive, more researchers should be invited to contribute within their respective fields of expertise.
- The weakest links of the simulation chain are currently those activities that stray from the established and validated industrial design practices. Currently, these tools and methods lie within TRL 3-6. They need to be further matured.

Thank you!
